

Maturity of preliminary design information self-assessment by information producer	
	CAD-File

Information Maturity being assessed:	4	3	2	1	0
(part name/number/unique identifier)					

Information produced and assessed by:	
(part name/number/unique identifier)	

Date of assessment:	

<b>COMPLETENESS</b> Maturity relating to content of the preliminary information	 <b>Coverage</b> How well is everything in place that I know has to be there?
	 <b>Depth</b> How fine-tuned is the information (are all aspects detailed or do rough placeholders exist)?
	 <b>Procedural Completeness</b> What is the information's formal or informal status?
<b>CLARITY</b> Maturity relating to presentation of the preliminary information	 <b>Nomenclature</b> How rigorously are suitable units, symbols and definitions provided?
	 <b>Conciseness</b> How confident am I that the lack of waffle/unnecessary repetition was
	 <b>Vagueness</b> How confident am I that there is no room for interpretation?
<b>CONSISTENCY</b> Maturity relating to meshing of the preliminary information within itself and with relevant context and Ambiguity.	 <b>Compatibility</b> How well is the information meshing with its environment or other information?
	 <b>Coherence</b> How well is the data meshing well within itself?
<b>DYNAMISM</b> Maturity relating to anticipated future change in the preliminary information	 <b>Ambiguity</b> Am I confident in the mental model of the content?
	 <b>Change Extent</b> How significant do I expect the information to change?
	 <b>Stability</b> How often do I expect the information to change?
<b>PREREQUISITES</b> Maturity relating to the inputs used for producing the preliminary information	 <b>Predictability</b> How well-known is the overall target and the related size of the problem to be overcome?
	 <b>Availability</b> How significant were the assumptions traced to proceed?
	 <b>Traceability</b> How well can I trace back the source of the information I used as an input?
<b>PROCESS</b> Maturity relating to the method used to produce the preliminary information	 <b>Credibility</b> How confident am I that the inputs are credible?
	 <b>Rigour</b> How rigorously did I apply the method?
	 <b>Suitability</b> How confident am I that the method used to create the information was appropriate?

<p>The CAD file I am providing contains <b>all needed (sub)assemblies</b> - regardless of how detailed each of these is worked out yet. I am sure that no (sub)assembly is still missing that should be there.</p>	
<p>The CAD file is worked out <b>until the finest level of detail</b> that is necessary (including rounds, tolerances, surface finished, appearance, etc.).</p>	
<p>The CAD-file has reached its <b>highest possible stage</b> we use in our organisation, either by being formally signed-off and/or the highest PLM status has been assigned, or if no such formal stages exist, it could be a <b>'deliverable'</b> to an internal/external customer</p>	<p>The CAD-file is <b>'enabled'</b> to be published for the official validation process</p>
<p>I have <b>checked the entire CAD-file</b> for conformance with company standards considering file names, model tree structure etc. <b>All units</b> ([m]vs.[inch]) material definitions, tolerances, origo, scale, data dependencies (no broken links) have also been checked.</p>	
<p>For the CAD file I am providing, <b>all unnecessary detail is hidden/deleted</b> (mannequins, architectural details, reference-drawings ...) is scrapped.</p>	
<p>Either I used <b>no workarounds</b> to leave room for interpretation or I <b>indicated these clearly</b> (such as extreme tolerances, "black boxes", etc.).</p>	
<p>I made sure my assembly has <b>no interferences</b> with spatially surrounding objects (if relevant: hole-patterns are matched, etc.). <b>Interaction</b> among sub-assemblies/parts is <b>fully defined</b> (e.g. motion joints, etc.).</p> <p>I made sure that <b>all owners of other parts being dependent on mine are kept in the update-loop</b>.</p>	
<p><b>All</b> my CAD file <b>inputs</b> have been checked to be the <b>latest</b> versions. Where appropriate, <b>all parameters are defined relative</b>, not absolute. In case of referenced/copied/mirrored/... parts, I <b>always</b> use proper <b>inheritance/linking</b> etc.</p> <p>I <b>strictly follow</b> our <b>data storage protocol</b> (if applicable: I properly use the PDM/PLM system).</p>	
<p>I have a <b>complete</b> mental model how to finish this CAD-file (e.g. I know <b>all</b> sub-assemblies needed to be included, where to get my data/resources to use etc.)</p>	
<p><b>None</b> of the sub-assemblies/parts are expected to change at all.</p>	
<p>The CAD-file is <b>stable</b> as I do not expect changes it to change anymore.</p>	
<p>I know <b>exactly</b> what the <b>final version of this CAD-file shall look like</b> and have a <b>clear impression of how much effort this will entail</b> (how big the problem to overcome is).</p>	
<p>For this CAD-file, <b>all needed inputs were available</b>. I did <b>not</b> have to make any <b>assumptions</b>.</p>	
<p><b>All</b> the sources of the input information used for this CAD-file can be <b>traced back easily</b> if needed.</p>	
<p>I am <b>very confident</b> that all the inputs I have used for this CAD-file are <b>credible</b>.</p>	
<p>I <b>used the most sophisticated features</b> of the CAD software and didn't take any shortcuts/didn't use any workarounds.</p>	
<p>I deem the underlying engineering science (testing or simulation [FEA, CFD, ...]) <b>adequate</b> for this CAD file's current project status. At early stages, based on hand-calculations, at medium stages based on initial testing/simulation, at final stages detailed testing/simulation.</p>	

<p><b>Most (sub)assemblies</b> that shall go into this CAD file are already there only a few (sub)assemblies might have to be added.</p>	
<p><b>Some</b> sub-assemblies of the CAD file are already <b>fine-tuned</b>, others contain placeholders or initial drafts for important parts which just need to be fine-tuned.</p>	
<p>The CAD-file is <b>'exhibited'</b> for the purpose of getting insights from my personal network.</p>	<p>The CAD-file is a <b>'draft'</b> almost ready to be shared.</p>
<p>I have <b>roughly checked most parts of the CAD-file</b> for conformance with company standards considering file names, model tree structure etc. <b>Most</b> of the units ([m]vs.[inch]) material definitions, tolerances, origo, scale, data dependencies (no broken links) have also been checked.</p>	
<p>For the CAD file I am providing, <b>most unnecessary detail is hidden/deleted</b> (mannequins, architectural details, reference-drawings ...) is scrapped.</p>	
<p>I used <b>some workarounds</b> to leave room for interpretation and I <b>indicated these more or less clearly</b> (such as extreme tolerances, "black boxes", etc.).</p>	
<p>I made sure my assembly has <b>only a few interferences</b> with spatially surrounding objects (if relevant: hole-patterns are matched, etc.). <b>Interaction</b> among sub-assemblies/parts is <b>mostly defined</b> (e.g. motion joints, etc.).</p> <p>I made sure that <b>most owners of other parts being dependent on mine are kept in the update-loop</b>.</p>	
<p><b>Most</b> of my CAD file <b>inputs</b> have been checked to be the <b>latest</b> versions. Where appropriate, <b>most parameters are defined relative</b>, not absolute. In case of referenced/copied/mirrored/... parts, I <b>mostly</b> use proper <b>inheritance/linking</b> etc.</p> <p>I <b>mostly follow</b> our <b>data storage protocol</b> (if applicable: I properly use the PDM/PLM system).</p>	
<p>I have a <b>rough</b> mental model how to finish this CAD-file (e.g. I know <b>most</b> sub-assemblies needed to be included, where to get my data/resources to use etc.)</p>	
<p>Only a <b>small fraction</b> of the sub-assemblies/parts might undergo <b>minor</b> (geometric) changes.</p>	
<p>The CAD-file <b>might change infrequently</b>, such as at design reviews or quality gates during the project runtime.</p>	
<p>I have a <b>rough idea</b> of how the final version of this CAD-file shall look like, I can <b>roughly estimate the amount of effort needed</b>.</p>	
<p>I had to make <b>some minor</b> assumptions for this CAD-file, but I am <b>confident</b> that these will hold/prove to be valid and I <b>indicated (annotated etc.) these clearly</b>.</p>	
<p><b>Most</b> of the sources of the input information used for this CAD-file can be traced back with <b>some effort</b> if needed.</p>	
<p>I am <b>somewhat confident</b> that all the inputs I have used for this CAD-file are <b>credible</b>.</p>	
<p>I had to use <b>some shortcuts/workarounds</b> (either to cope with the deadline or because I don't know how to do it properly), if this CAD-file shall be integrated into a broader assembly, expert review <b>might be required</b>.</p>	
<p>I deem the underlying engineering science (testing or simulation [FEA, CFD, ...]) <b>a bit too basic</b> (e.g. more detail should have been used) or a bit too sophisticated (e.g. too high computational effort) for this CAD file's current project status.</p>	

<p>I know <b>several (sub)assemblies</b> that should be there <b>are not there yet</b>.</p>	
<p><b>Several</b> (sub)assemblies are <b>roughly in place</b>, either just consist of a skeleton structure, are simple solids lacking detail, appear final but are just carry-over, or downloaded parts or are not even there yet.</p>	
<p>The CAD-file is <b>not even a "draft"</b> but just an idea or a hypothesis I have in mind but not to be shared yet.</p>	
<p>I have <b>not yet checked parts of the CAD-file</b> for conformance with company standards considering file names, model tree structure etc. Some units, material definitions, tolerances, origo, scale may be missing, missing data dependencies (broken links) are likely to exist.</p>	
<p>For the CAD file I am providing, <b>some unnecessary detail is hidden/deleted</b> (mannequins, architectural details, reference-drawings ...) is scrapped.</p>	
<p>I used <b>many workarounds</b> to leave room for interpretation but I <b>did not indicated these clearly</b> (such as extreme tolerances, "black boxes", etc.).</p>	
<p>My assembly <b>might have several interferences</b> with spatially surrounding objects (if relevant: hole-patterns are matched, etc.). <b>Interaction</b> among sub-assemblies/parts is <b>not yet defined</b> (e.g. motion joints, etc.).</p> <p>I have <b>not considered owners</b> of other parts <b>being dependent on mine</b>.</p>	
<p><b>My CAD file inputs</b> have <b>not been checked</b> to be the <b>latest</b> versions. Some parameters are <b>defined relative</b>, some absolute. Referenced/copied/mirrored/... parts might be unreferenced. I <b>did not follow</b> our <b>data storage protocol</b>.</p>	
<p>I have to find out what is required for this CAD-file.</p>	
<p><b>Most</b> sub-assemblies/parts might undergo <b>severe</b> changes.</p>	
<p>As this CAD file I am providing shall be understood just as an initial draft, I expect it to change <b>very frequently</b>, either as new information becomes available or at the weekly meeting with my boss.</p>	
<p>I <b>don't know</b> how the final version of this CAD-file shall look like, what problems have to be solved underway and/or how much effort this requires.</p>	
<p>I had to make <b>several assumptions</b> in order to get this initial draft of the CAD-file out, my confidence that the assumptions I made were realistic is quite low and I <b>did not indicate</b>, and differentiate these assumptions from hard facts.</p>	
<p>I <b>do not know</b> where the input information used for this CAD-file stems from, <b>some might</b> be copy/paste from a colleague's flash drive.</p>	
<p>I am <b>not confident</b> that all the inputs I have used for this CAD-file are <b>credible</b>.</p>	
<p>Given my basic understanding of this CAD-package, I probably used <b>many basic features</b> of the CAD software and did take many shortcuts/did use many workarounds. <b>Expert review is definitely needed</b>.</p>	
<p>I deem the underlying engineering science (testing or simulation [FEA, CFD, ...]) <b>way too basic</b> (e.g. a lot more detail should have been used) or <b>too sophisticated</b> (e.g. excessive-high computational effort) for this CAD file's current project status.</p>
